Gambler's Ruin

Definition

Given infinite time, all gambler's go bust.

Death of a taxon

Taxa as gamblers

All taxa, given infinite time, go extinct.

Foundation

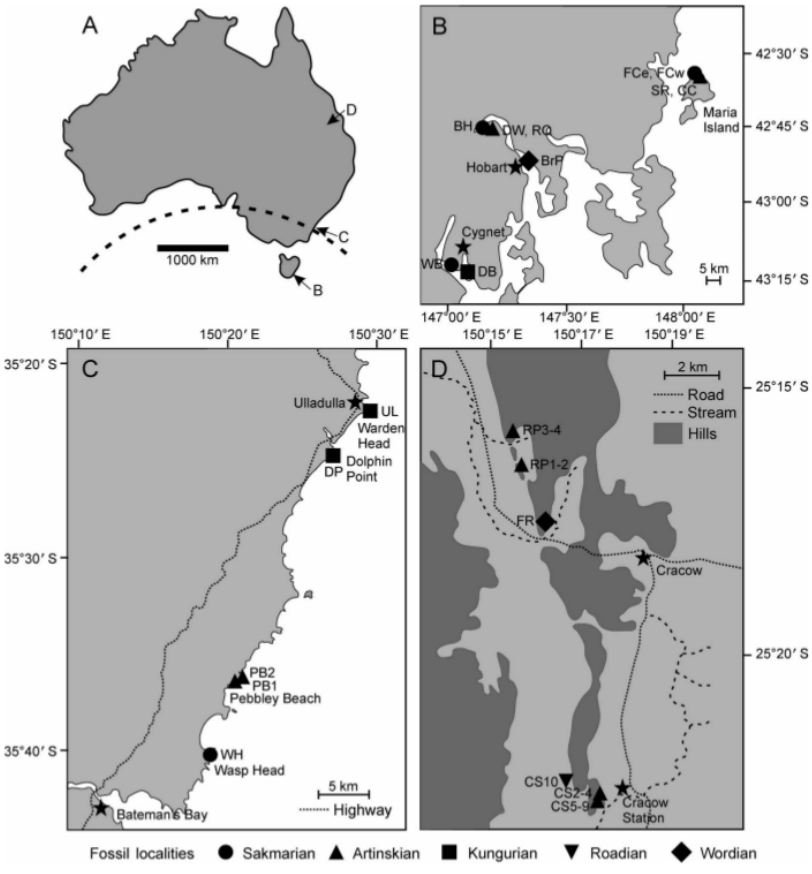
Question

Why do taxa go extinct at different rates?

Enter brachiopods

(Immersion Imagery, Shutterstock; Wikimedia)

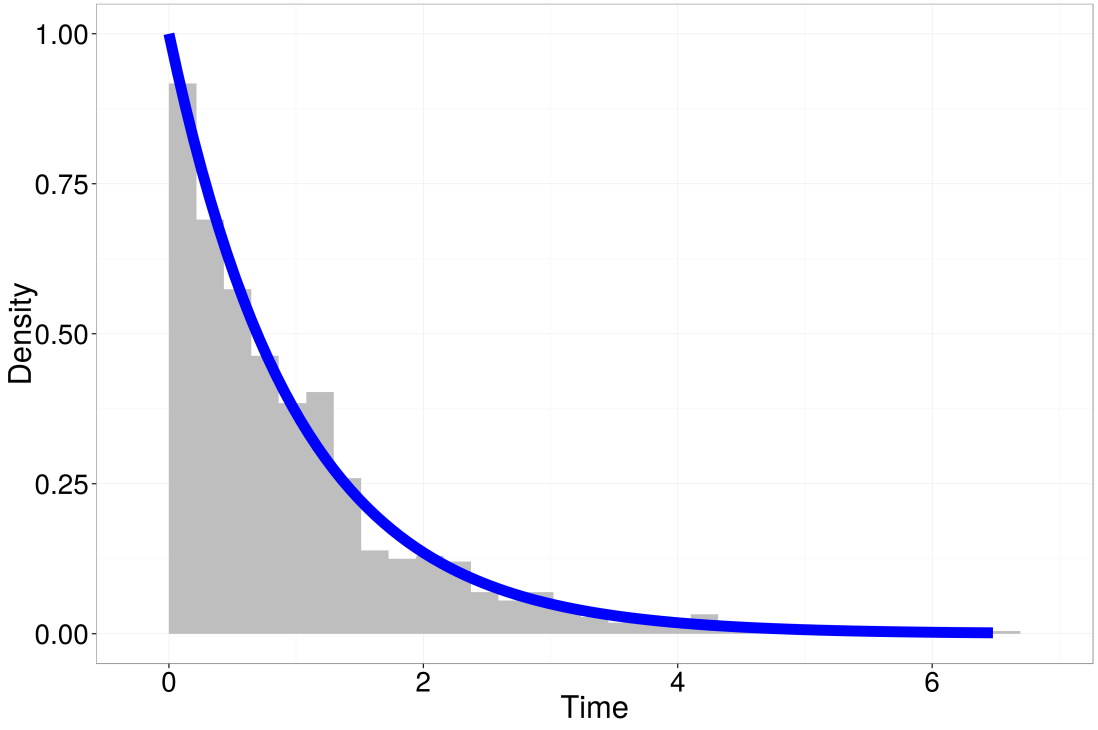
System details

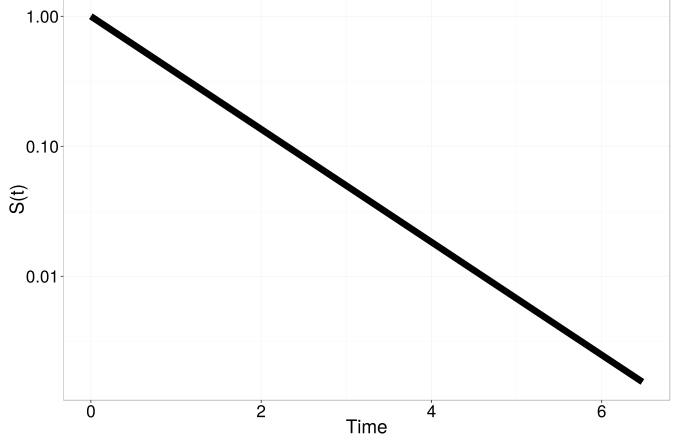


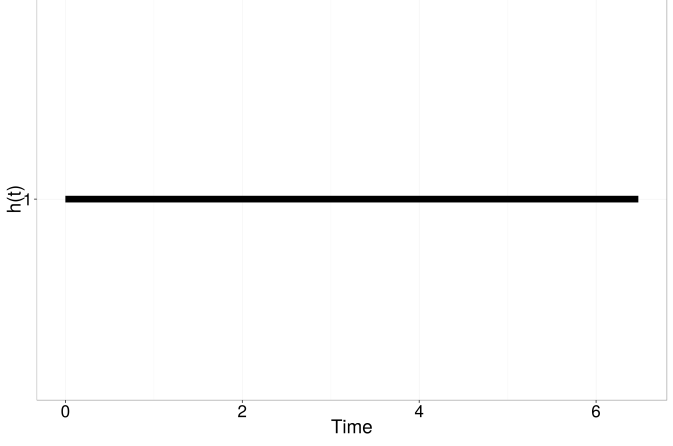
(Clapham and James 2008 *Palaios*)

- Australian Permian
  - range in/out taxa right censored
- predictors
  - substrate probability (fully Bayesian approach)
  - onshore/offshore
  - body size (Payne *et al.* 2014 *Proc. B*)
  - occupancy (see Vilhena *et al.* 2014 *Nature Com.*)

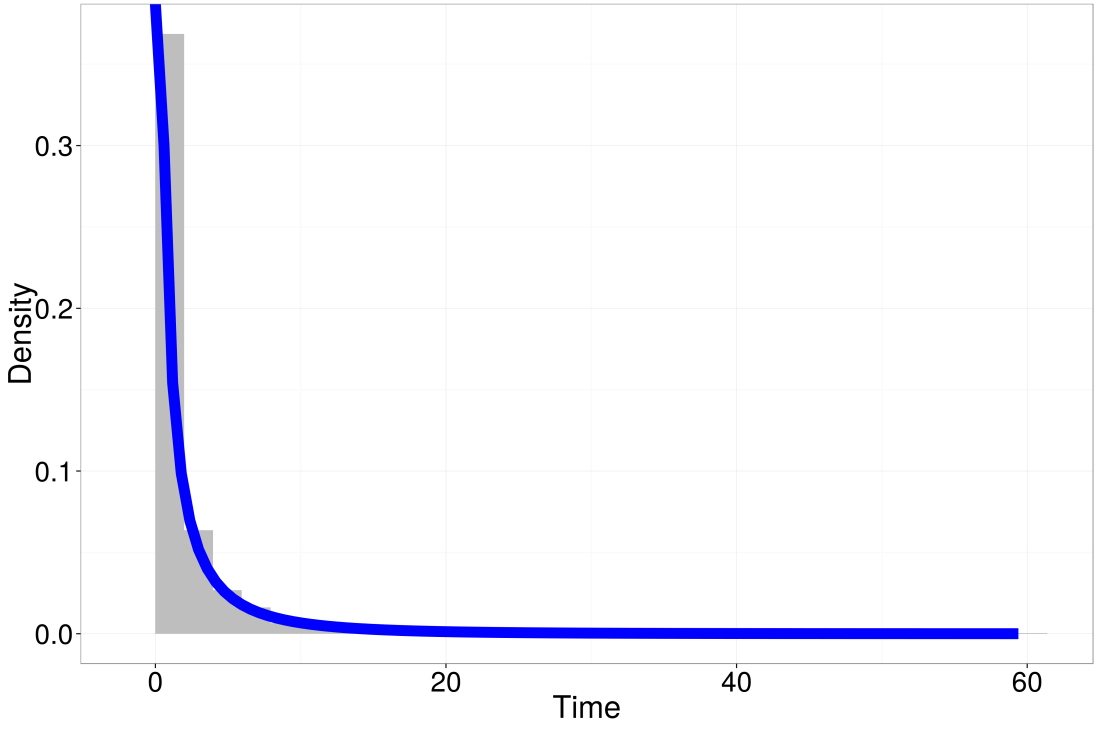
Survival analysis

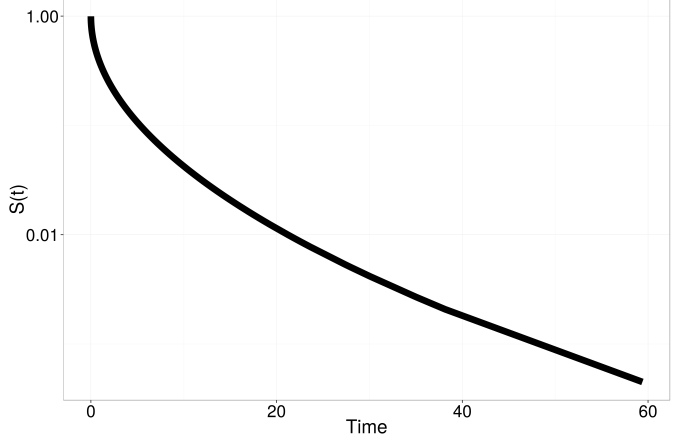


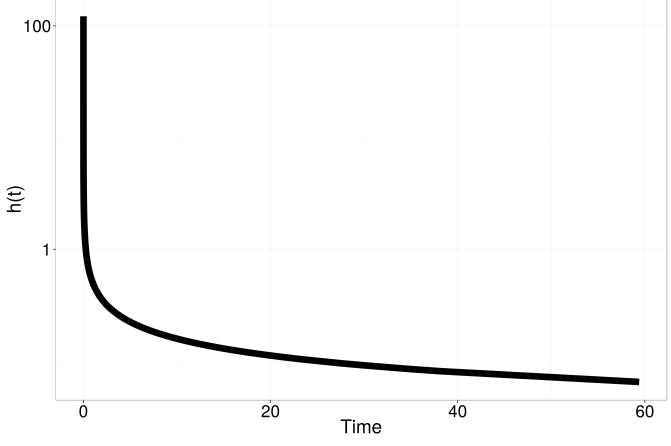




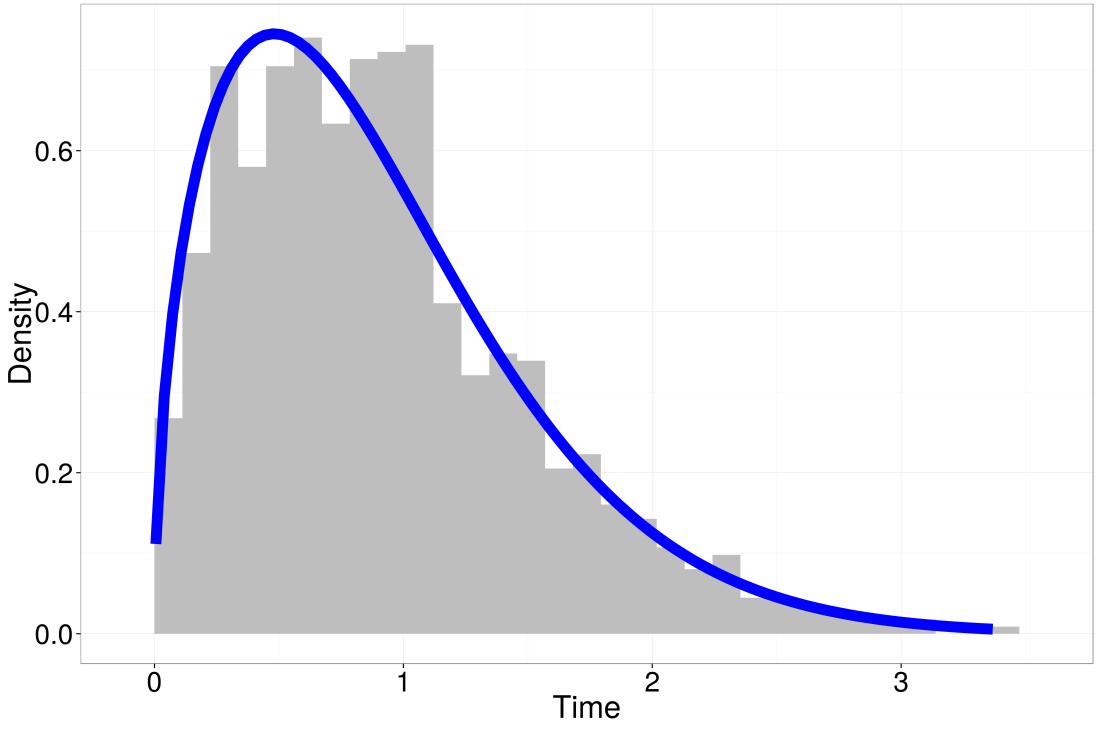
Survival analysis

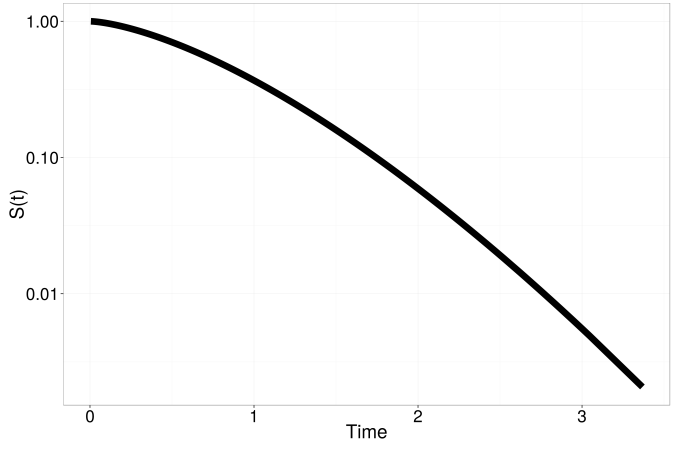


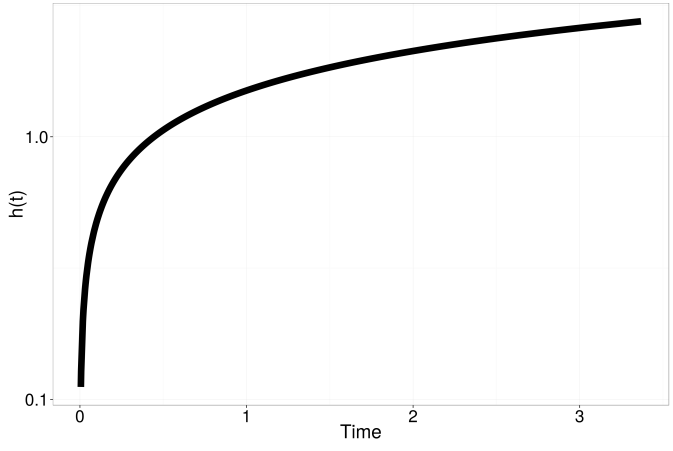




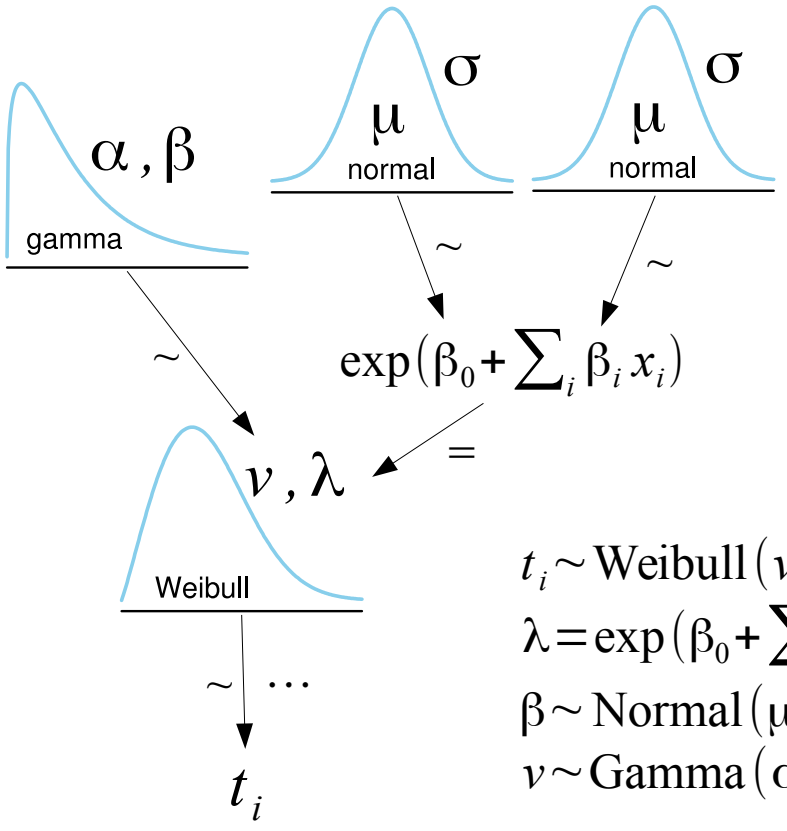
Survival analysis





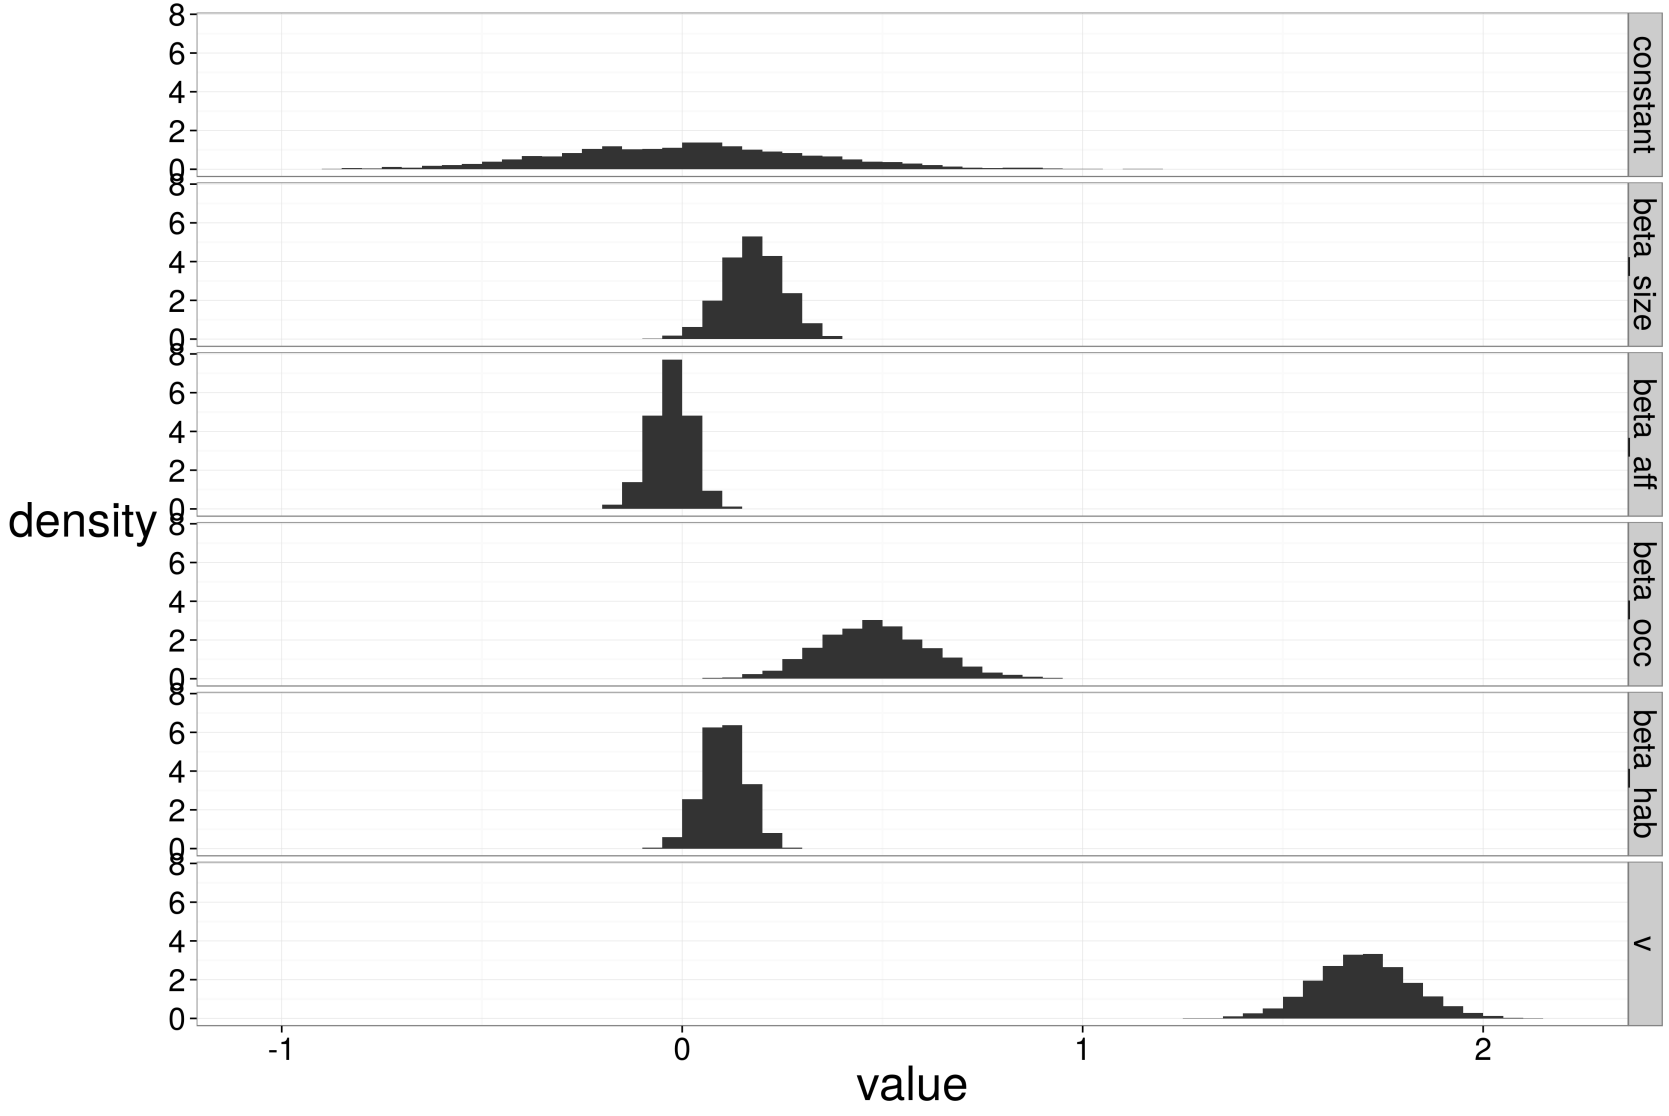


Bayesian model structure

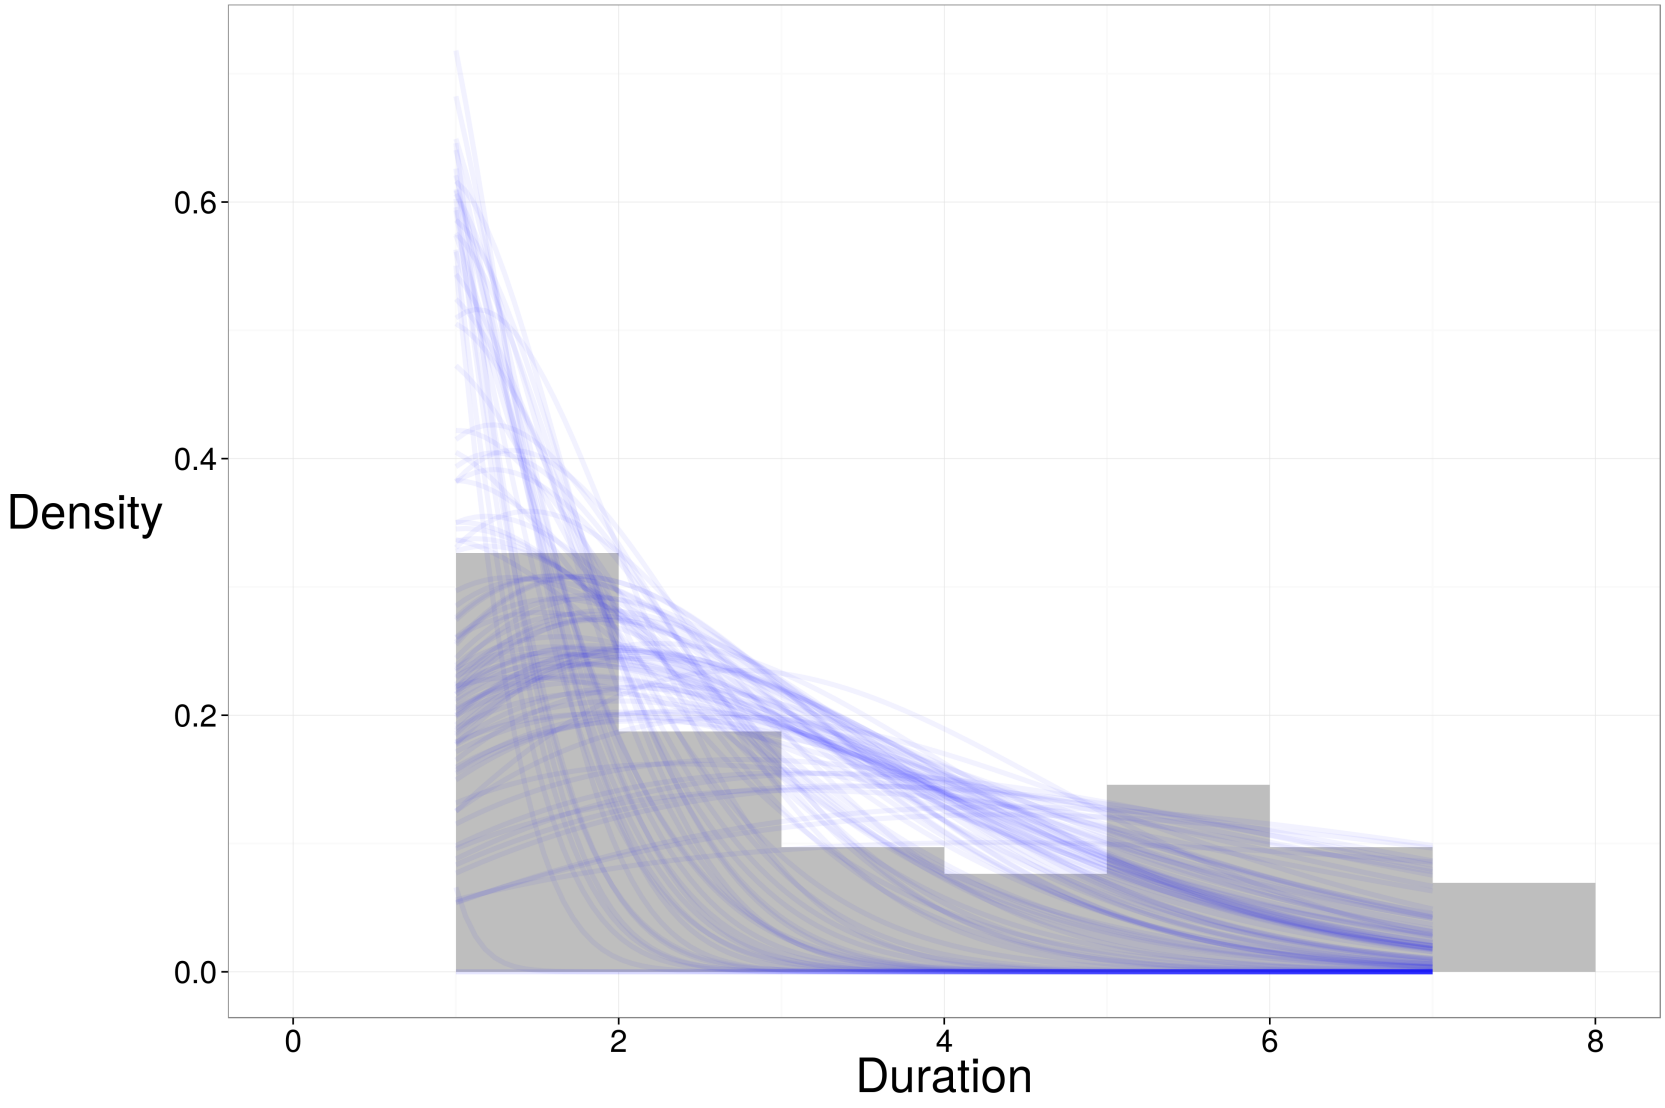


$$t_i \sim \text{Weibull}(\nu, \lambda)$$
$$\lambda = \exp(\beta_0 + \sum_i \beta_i x_i)$$
$$\beta \sim \text{Normal}(\mu, \sigma)$$
$$\nu \sim \text{Gamma}(\alpha, \beta)$$

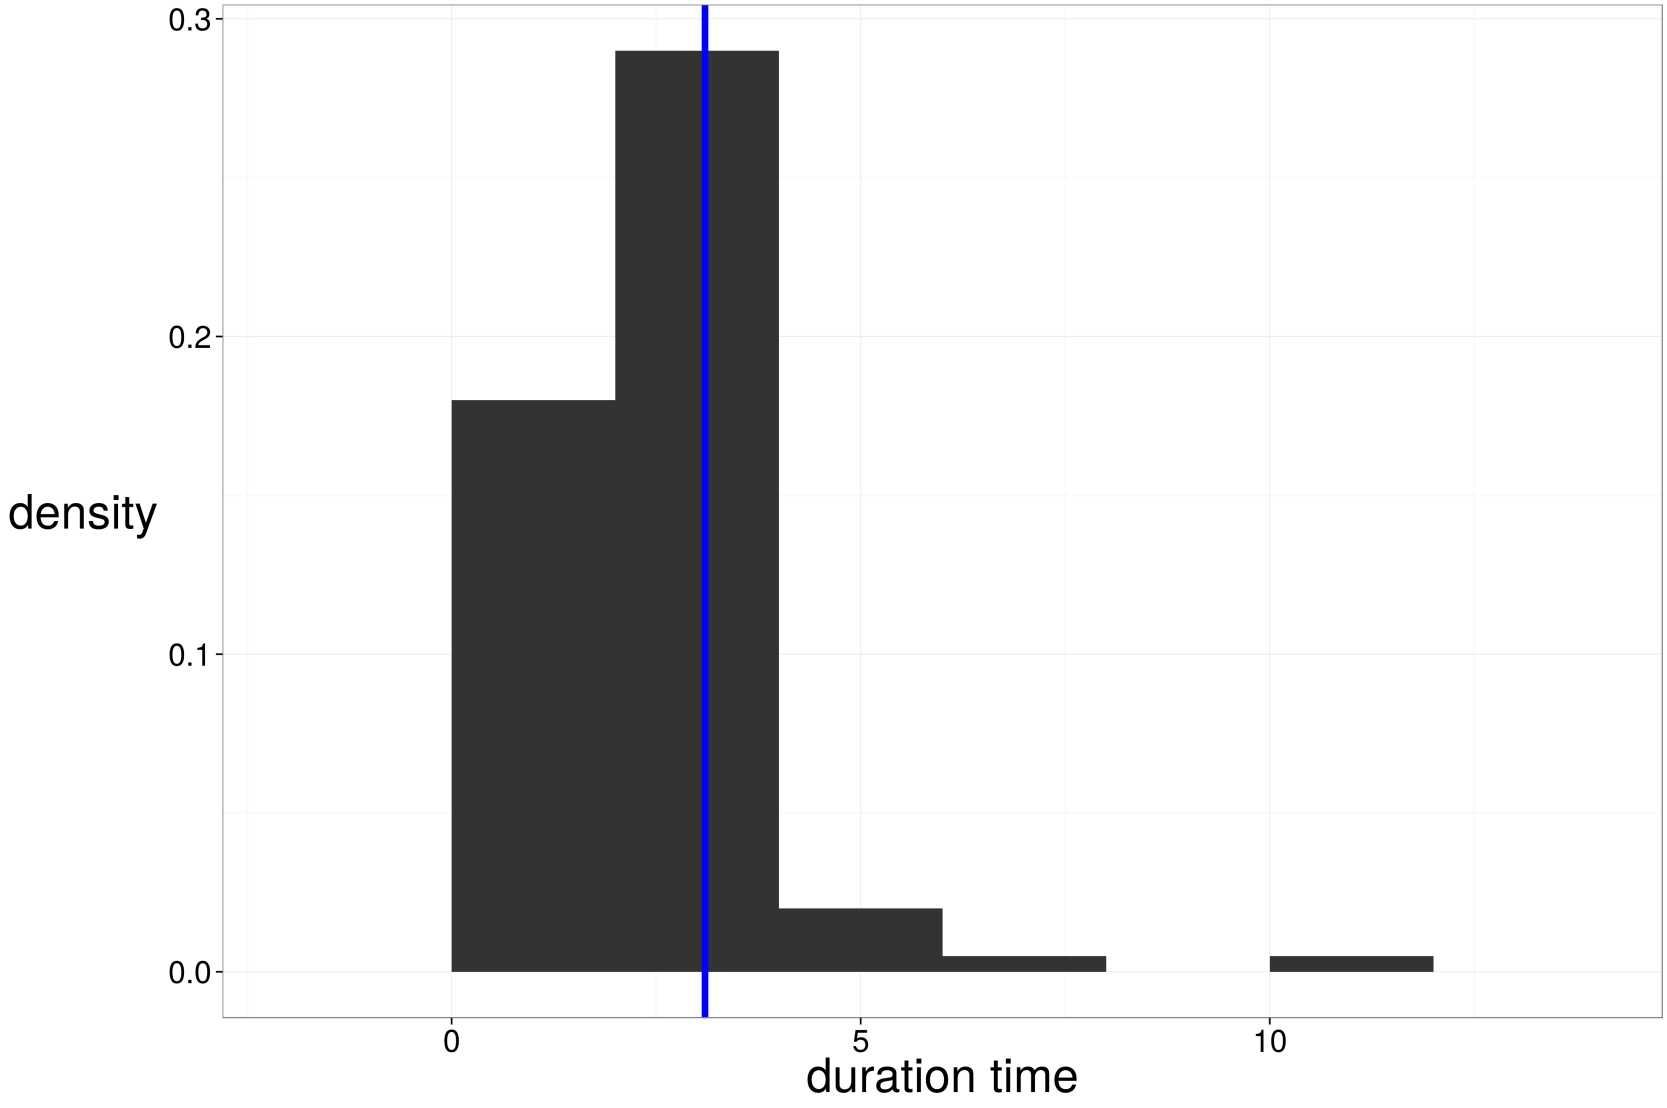
Parameter marginal posteriors



Durations



Posterior predictive check: mean duration



State of knowledge

Conclusions

Extinction is age-dependent ($v > 1$).

Occupancy has largest effects.

Nonlinearity or heterogeneous variance in size, affinity, habitat.

Overall, current model has problems at the tails.

Improvements

Modeling roadblock

HEAVY TAILS

- Data
  - New Zealand (FRED)
  - improved paleoenvironment reconstructions
  - affixing strategy information
- Model
  - robust priors
  - change sampling dist.
  - non-linearity/heterogeneous variance
  - sampling
